Feedbacks given to me

Henry, a graphic designer friend of mine said:

- That the article lines did not match with each other and that the desktop version's main article is too big

- Steps I took to solve this issue:

- Re-hauled my CSS Grid entirely to make it more rigid and structured which fixed most of the issues

- I also added a nested CSS Grid in my main article so that the main image isn't too big
  - Taking inspiration from this, I also added some nested CSS grids on the articles following down the big article

Hannah D. said:

- The alignment of desktop/tablet css grid was a little off and doesn't line up.

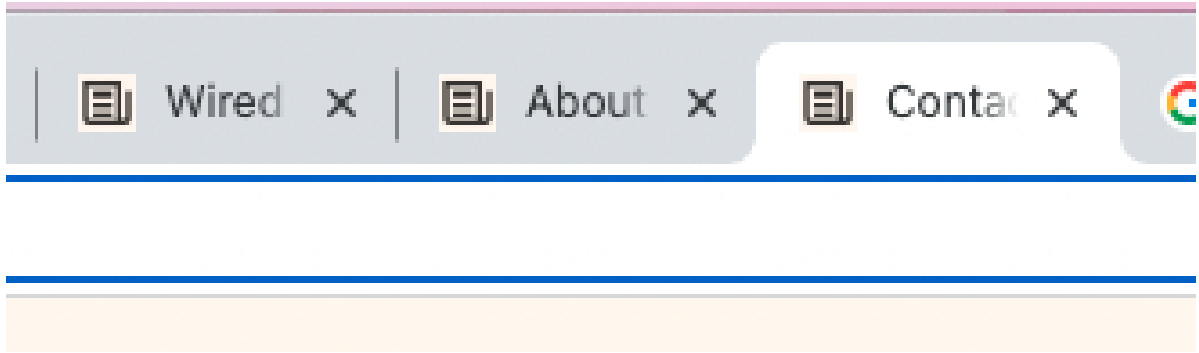

- Steps I took to solve this issue:
  - Targeted the desktop media queries and adjusted the padding of each heading
  - In addition, I also adjusted the header font-size to fit the space more

Caitlin R. said:

- That the page titles are confusing because I kept switching between the company name and the page names

- Steps I took to solve this issue:

  - Reorganized and tidied up the page titles following a format that goes like: "[Page Title Here] – Company Name"

  - By using this format, it will avoid confusion on the users and create more cohesion on the website,

- Things I also noticed:

  - During this time, I found out that I didn't have a description for my pages so I quickly fixed that up too.
